Introduction. Environmental insults such as extremes of temperature, extremes of water status as well as deteriorating soil conditions pose major threats to agriculture and food security. Employing contemporary tools and techniques from all branches of science, attempts are being made worldwide to understand how plants respond to abiotic stresses with the aim to help manipulate plant performance that will be better suited to withstand these stresses.

Abiotic Stress Adaptation in Plants: Physiological -

The present chapter focuses on understanding the different responses of the plants involved in abiotic stress adaptation and strategies employed to date for achieving stress resistance in plants. Exposure to abiotic stresses has become a major threatening factor that hurdles the sustainable growth in agriculture for fulfilling the growing food demand worldwide.

Abiotic Stress in Plants - Mechanisms and Adaptations -

Metabolic Adaptations in Plants during Abiotic Stress covers a topic of past, present and future interest for both scientists and policy makers as the global challenge of climate change is addressed.

Metabolic Adaptations in Plants During Abiotic Stress -

Abiotic stresses negatively influence plant growth and productivity and are the primary cause of extensive agricultural losses worldwide (Arun and Venkateswarlu, 2011; Ye et al., 2017). Reduction...

Strigolactones in plant adaptation to abiotic stresses: An emerging avenue of plant research. Phytohormones play central roles in boosting plant tolerance to environmental stresses, which negatively affect plant productivity and threaten future food security. Strigolactones (SLs), a class of carotenoid-derived phytohormones, were initially discovered as an "ecological signal" for parasitic s ...

Strigolactones in plant adaptation to abiotic stresses: An -

Drought, low or high temperature, salt stress and acidic conditions, heavy metal stress, nutrient stress and starvation are the major abiotic stresses that harm plants (Chaves and Oliveira 2004).

Induction of abiotic stress tolerance in plants by -

Abstract: Abiotic stresses cause plant growth inhibition, damage, and in the most severe cases, cell death, resulting in major crop yield losses worldwide. Many abiotic stresses lead also to oxidative stress. Recent genetic and genomics studies have revealed highly complex and integrated gene networks which are responsible for stress adaptation.

Reactive Oxygen Species and Abiotic Stress in Plants

Abiotic stresses are the primary sources of crop losses globally. The identification of key mechanisms deployed and established by plants in response to abiotic stresses is necessary for the maintenance of their growth and persistence. Recent discoveries have revealed that phytohormones or plant growth regulators (PGRs), mainly jasmonic acid (JA), have increased our knowledge of hormonal ...

Jasmonic acid: a key frontier in conferring abiotic stress -

Abiotic stresses such as drought, are the main factors for forest declines globally. There is therefore an increasing interest in understanding the mechanisms underlying tree adaptations and survival to water deprivation. Angiosperm tree species demonstrate an amazing phenotypic plasticity.

Abiotic Stress Adaptation in Plants: Physiological -

When there is limited bioavailable P in the soil, plants show extensive abiotic stress phenotype such as short primary roots and more lateral roots and root hairs to make more surface available for P i absorption, exudation of organic acids and phosphatase to release P i from complex P containing molecules and make it available for growing plants' organs.

Abiotic Stress Adaptation in Plants: Physiological -

In nature, plant growth and productivity are impacted by a variety of abiotic stresses, including drought, heat, salinity and low temperature. Therefore, plants have evolved several molecular mechanisms which allow them to adapt to and survive nonoptimal growth conditions (Hirayama and Shinozaki 2010).

Biological Function of Changes in RNA Metabolism in Plant -

Plants have evolved adaptive measures to cope with abiotic and biotic challenges simultaneously. Combinatorial stress responses require environmental signal integration and response prioritization to balance stress adaptation and growth. We have investigated the impact of salt, an important environmental factor in arid regions, on the Arabidopsis innate immune response.
